The facility is uncomplicated:

1. The player places a wager in their chosen cryptocurrency (e.g., Bitcoin, Ethereum, GBPT, or Dogecoin).
2. The player sets a **target multiplier** (e.g., 2x, 10x, 100x, or perhaps 1,000,000 x).
3. The game generates a random multiplier result.
4. If the produced multiplier is **higher than or equivalent to** the target multiplier, the player wins. If it fails, the bet is lost.

Because the game is hosted on crypto platforms, practically every reputable version of Limbo is **provably fair**. This indicates players can separately validate the cryptographic hash of every round to make sure the gambling establishment did not control the result.

The Core Equation

Generally, the win chance is calculated as:£ £ \ text Win Chance (%) = \ frac 100 - \ text Home Edge (%) \ text Target Multiplier £ £

For example, on a platform with a 1% home edge:

- If a gamer sets a target of **2.00 x**, the win opportunity is roughly **49.5%**.
- If a gamer sets a target of **10.00 x**, the win chance drops to **9.9%**.
- If a player sets a target of **100.00 x**, the win opportunity plummets to **0.99%**.
