

Plan flower orders by estimating customer demand, confirming what suppliers can provide, and ordering early enough to get the stems you need. Leave room for uncertain sales, substitutions, delivery delays, and the limited life of cut flowers.

Use previous sales to estimate demand

Review sales records from earlier seasons. Note how many arrangements you sold, which flowers went into them, and when orders came in. Keep advance purchases separate from last-minute sales, because those patterns call for different stock levels.

Look for repeat demand around occasions such as Valentine’s Day, Mother’s Day, graduations, and year-end holidays. Local events deserve attention as well. A graduation date or a large wedding may shape demand in one week more than a national holiday.

Treat past sales as a guide rather than a promise. Change your estimate if your opening hours, customer count, or business size has shifted. Write down why you made each adjustment, then revisit those reasons after the season.

Confirm availability and delivery dates

Ask suppliers what flowers they expect to have, when you need to place an order, and which delivery dates are possible. Growing conditions and supplier sources affect availability, so a flower linked with a particular season may still be unavailable.

Work backward from the date your customers need their arrangements. Make time for the delivery, flower inspection and conditioning, arranging, and customer pickup or delivery. Before a major holiday, confirm how

much lead time each supplier requires.

Agree on suitable replacements before you place an order. Discuss the colors, flower types, and sizes that can stand in for a stem if it is unavailable. Having options ready helps you respond without redesigning every arrangement at the last moment.

Choose quantities and place orders in steps

Convert your demand estimate into a stem count for each arrangement. First add the flowers needed for confirmed orders. Then estimate stock for walk-in customers and online orders that have not come through yet.

- Set aside flowers for confirmed orders before anything else.
- Choose flexible colors and varieties to cover uncertain demand.
- Include some allowance for stems that arrive damaged or cannot be used.
- Check your storage capacity before raising the order quantity.

If suppliers allow it, order first for the demand you can predict, then place another order when sales become clearer. Before you depend on that later order, ask about minimum quantities and delivery schedules. A second order can give you more flexibility, but your preferred flowers may have sold out.

Keep records and refine the plan

During the busy stretch, track deliveries, sales, and leftover stock. Record substitutions, late arrivals, damaged stems, and orders you were unable to fill. Check your inventory every day, use older flowers first when they are still suitable, and avoid buying more than you can store or sell.

Once the season ends, compare your forecast with actual sales and waste. Keep the results alongside supplier deadlines and order quantities. Those records give you stronger evidence to use for your next seasonal plan.
