One of the typical growths that accompany aging is the development of age places. Age spots are safe adjustments to the skin that do not cause pain. Sometimes, though, their appearance might cause some psychological distress, or even issues regarding skin cancer cells.

Name	Photo	Description	Zones of occurrence
Moles (nevi)		Congenital or acquired with age formations that are overflowing with melanin pigment. It is due to this pigment that moles can be from almost colorless to black. Outwardly, they are spots, tubercles or nodules on the skin. Most often, moles are benign neoplasms of the skin, but degeneration of the formation into melanoma is also possible. Therefore, moles need to be monitored and examined regularly	They are found on various areas of the skin, including the palms and soles.
Papillomas		Small outgrowths of the upper layer of the skin or mucous membrane, located on a thin stalk and have a cylindrical shape. Most often, the color does not differ from the color of the skin, but can also acquire various shades of brown. The reason for the appearance of such benign formations is the human papillomavirus (HPV), more than 100 strains of which have been found.	They occur most often in the neck, armpits and genitals, but can form anywhere on the body.
Seborrheic keratomas		The most common type of tumor, especially among people over 40 years of age. The number of these benign skin tumors can vary from a few to a couple of dozen. The color varies from light yellow to dark brown, seborrheic keratomas are rough to the touch and have horny cysts on their surface.	They are localized most often on the face, scalp, chest and back.
Angiomas		Vascular formations that appear on the skin in the form of small red spots. Such benign skin lesions occur in 80% of people in various parts of the body. Angiomas are especially common on the skin of older people whose capillaries have lost their elasticity.	They can be localized on the abdomen, back, arms, legs, face, neck and scalp.
Stellate hemangiomas		A dense red nodule of a small size, from which vascular capillaries diverge to the sides.	Most often localized on the face, neck.
Viral warts		Horny dense and dry elevations with an uneven villous surface. The size can reach 1 cm or more, often merge into large plaques. The color may be flesh, greyish or brown.	Most often localized on the hands and feet, knees, elbows, can also be on the torso, face and scalp.
Dermatofibroma		Fibrous nodule, which most often appears on the skin of the lower leg. The size can be from 0.5 to 1.5 cm in diameter. The color is both light pink and various shades of brown.	They are localized more often on the legs and hips, back and shoulders, less often on other parts of the body.
